

Hypothesis

The purpose of all genes is to spread themselves to the greatest degree.

What would the best way of spreading your genes as a human being be in a vast human society?

- Get yourself a good education so that you can give a materialistically safe life to your children, and so that they will have the better opportunity to do the same for their children again. You need have all your descendants for generations to come do this.
- Education depends on high IQ. In order to get intelligent children you would need to marry an intelligent and well educated partner who has the genes for it. Your children and their children and all your descending generations would need to do the same.
- Material privileges are best obtained by a group where the members cooperate and show some degree of altruism while they are exploitative towards non group members. Sole individuals working alone to obtain material privileges will be outcompeted by such a group. For this reason your descendants for all generations to come would have to have group cohesion and group cooperation and be exploitative towards non group members.
- Two things will be experienced by this group:
 - 1) This stock of high IQ in-group cooperative people will experience that some of their group members marry people of a lower IQ. That offspring will on average have a lower IQ.
 - 2) Also two intelligent members can give birth to some less intelligent children due to the variation that all people's genome contains.These two causes are a threat to the existence of that highly intelligent group of your descendants. Therefore this group has to create an action parameter that makes the individuals of lesser IQ and non educated members (and their spouses) to deflect and join the regular society that the group lives within.

Problems to solve in order to fulfill these requirements

- Find an intelligent and well educated marriage partner.
- Make your descendants find an intelligent marriage partner. This will largely work by itself as human beings largely marry by social status. Well educated marries well educated. But you would need some factor

that urges your descendants to do this as not everyone of high education necessarily strive for accomplishing this.

- Make your descendants for all generations to come to have group cooperation and being exploitative towards non group members.
- Make those of lesser IQ deflect and join regular society.

Solution of problems

The only thing that can make any person live by a special set of rules and act accordingly to them is religion because the human species does not operate its life by and listening to an excellent idea, and then implementing the pure logics and rationality to achieve that goal. Ideas and the obvious logical implementations of it is simply not enough to make people act in a certain way.

As the generations would pass this group would have grown to quite large numbers. During this growth there would have been some selection on the genes of this group. The people not possessing the psychological basis for group cohesion and group identification would not see the good reasons for belonging to such a group and they would deflect. The same with people who do not possess the psychological basis for profound religiousness.

So in the end, after many generations, the result would be a group of individuals of exceptionally high IQ, strong group cohesion, exploitative behaviour towards non group members and a deep religiousness. And all these psychological traits would have a genetic basis.

After this group has grown to the numbers of perhaps 5000 individuals then it would be time to introduce a new rule. This rule would have to make the members marry only group members. This would make sure that your already "genetically bred" group of people would marry people possessing similar genes for similar mental qualities. As generations would pass again this would purify the race of this group and make sure that all members had the same genetic basis for certain psychological properties and high IQ. A new race of people would have been created where the race had been bred for certain psychological properties and a high IQ, in addition to practicing a religion that keeps it all together.

End phase

Such a group of within-group cooperative, non-group exploitative and high IQ people consisting only of academics would after some generations when their numbers had grown significantly become present in all sectors of society, especially at the top levels. They would in time in fact dominate all the top levels of society. They would be in business life (international enterprises and banks), the legal institutions (lawyers and judges), in politics as politicians, the universities as professors of science and the social sciences, arts, entertainment (TV and cinema productions). In short they would be able to gradually manipulate people by creating political ideologies, governing the media and the entertainment business and having their seats in numerous important positions. By access to academia and media they could spur revolutions, manipulate financial life which again can start wars – in short they would try to influence the people of this world to act to satisfy the group's needs and not just the people's needs. They would in fact be designing their environments (societies) so that they could dwell within them much more comfortably and in control of them.

The populations they would be living within would be their "slaves" – that's us. We would form the labour stock and they would be living as parasites within the host society and benefit on our work and war effort. In short it would be a parasite – host relationship where the parasite actually is partly controlling the actions of the host. (In nature there are parasites that take over the brain controls of animals and control their behaviour to their own advantage by destroying the survival ability of the host.)

When will this happen?

What I have been discussing here is evolution. Natural selection and evolution.

What is important to understand is that evolution is a constant process. Nature is constantly producing evolutionary experiments that compete for survival and reproduction. That is simply how all the millions of living species in this world today have come to exist, and the process of evolution is continuing at this moment as you are reading this. It is never standing still and Nature is very good at doing this. So what is important to understand here is that this scenario of human group parasite evolution that I have created is going to happen as soon as there is an available niche for such a group, just like new species arise in nature whenever there is a niche available. This is unavoidable. Nature works constantly to find new genetic possibilities and it always succeeds in creating something new.

So what would a good niche be for such a group? Such a group needs to exist onto the work of others. So this group needs a civilization to thrive on. Civilization has existed for thousands of years. In other words we should expect that this group already exists and if it has existed for thousands of years then we should expect it to be a large group already dominant in the top level of one or several countries.

The creation scenario that I have made does not have to be a correct description of how this group came to be created in real life. But I have correctly identified an available niche in modern society and it is already filled by such a group. The creation scenario that I made is merely a crutch of thinking to help myself putting my mind in the place of “the selfish gene” and starting from “nowhere” with nothing to build from except for “me – the selfish gene” who one day decided to grab the dominant position. It is to help my mind go with the flow of natural selection and evolutionary pressures.

So the evolutionary path I made is not certain because Nature can work in a myriad of ways, but the available niche is certain. And it is certain that it is already occupied.

Here are a set of objective criteria for identifying such a group:

- It must be a religious group
- The members are on average extremely intelligent
- The members are on average extremely well educated
- The members are unproportionally well represented in all top levels of society; science & humanities, authors, politicians, finance and even entertainment (TV and film productions).
- They will also have a strong historical record of great intellectual achievements
- They will have an unproportionally high representation as Nobel Price winners.
- They will also be present in history as key figures in great political and intellectual movements, often leading to great changes in society and even revolutions. They might not be front figures, but still key figures in some way.
- They will also have been the center of some wars in history but they will not necessarily have done all the war effort by themselves.
